

## The 2021 Spike

February 22, 2023

The graph is startling. It [shows](#) VAERS reporting numbers in Florida from 2006 through 2022.

VAERS is the Vaccine Adverse Event Reporting System. Little blips of data run along the bottom of the graph through 2020, a year in which there were 2466 reports of negative effects.

And then came 2021, the year in which mRNA and adenovirus vaccines were rolled out in the United States, pushed heavily by the federal government

***But nearly all other governments have failed to acknowledge such data much less act on it “in meaningful ways”***

and All Responsible Opinion, subsidized per the dose to the drug companies, as well as by lifting the burden of liability for . . . *adverse effects*.

The number of Floridians reporting such adverse effects soon after taking the vaccines spiked to 41,473.

The next year it subsided a bit, but to an otherwise walloping high of 9,104.

“In Florida alone, there was a 1,700% increase in VAERS reports after the release of the COVID-19 vaccine, compared to an increase of 400% in overall vaccine administration for the same time period,” Florida Health tells us in the online [“Health Alert on mRNA COVID-19 Vaccine Safety,”](#) of February 15. “The reporting of life-threatening conditions increased over 4,400%. This is a novel increase and was not seen during the 2009 H1N1 vaccination campaign.”

“Just publish the data; give us the facts,” Dr. John Campbell [stated](#) in his online talk on the report. He’s appreciative of the Sunshine State’s newfound transparency: “Well done, State of Florida.”

But nearly all other governments have failed to acknowledge such data much less act on it “in meaningful ways”: “badly done, other 49 states. Badly done, the UK; badly done, Europe; badly done, Canada; badly done, New Zealand, Australia.”

Quite a spike in government “badly dones.”

This is Common Sense. I’m Paul Jacob.
