

# Denmark's Cows Must Die

November 26, 2025

## Sorry, cows. The planet comes first.

I don't want to give the wrong impression. No order has been issued requiring Danish farmers to kill their cows. The state is merely [requiring](#) that they feed the cows poison.

The purpose of the wonder-additive, Bovaer, produced by a company called Elanco Animal Health, is to limit the methane that cows produce as they digest their food. Then, says Elanco, the amount of methane that the cows emit—by a method too indelicate to mention—will be reduced 30 percent. Elanco must have done some kind of testing to figure this out, I suppose.

What is the point, though? Why does anybody want to accomplish this?

Well, the central planners who mandate such things believe or say they believe that even a smidgen less methane in the air will enable them to fine-tune the global climate thus wise and so and thereby, something something something, a perfect optimization. Well, not perfectly perfect, not until all the bovines everywhere are gobbling Bovaer. Denmark is [not the only country](#) pushing the drug though.

Alas, some Danish farmers are being obstreperous, complaining that their cows are getting sick: lethargy, diarrhea, miscarriages, drops in milk production. Etc. Some are even dying as result of the additive.

It is sad. But I'd rather have a few dead cows than a dead planet with nonstop hurricanes and tornadoes. And that's what's gonna happen if we don't find a way to inhibit the cows' ... methane emissions.

This is Common Sense!! I'm Paul Jacob.
